

Project

Subject: create an application in the programming language of your choice, but which respects the technical constraints of the course (Rest/RPC web service, access to a database).

Best practices:

- Git: one folder per service / sub-project
- Layers (web, services, entities)
- Inversion of Control (IoC) => autowired (Java)
- Logger à la place des System.out
- Exception handler for HTTP errors with messages
- Stateless web service

<https://github.com/charroux/rentalservice>

Architectural advice (not mandatory):

Client -> Web service Rest (client RPC) -> serveur RPC

DBMS

DBMS

Options:

- Clients (framework Java Script, Androïd)

Pair work.

Deadline: September 27.

Deposit space:

- Moodle
- A short documentation explaining the architecture
- Link to the Git repo
